

IN THE CLAIMS

1. (Previously Presented) An interactive voice response system comprising:
a compiler operative to compile documents retrieved by a fetcher into compiled document data in executable form;
a cache which stores the compiled document data prior to receipt of audio input from a given user requesting a text-based document; and
an execution thread that executes compiled document data retrieved from the cache by the fetcher.
2. (Previously Presented) A system according to claim 1 also comprising a storage device, which stores state information related to execution of said compiled document data.
3. (Previously Presented) A system according to claim 2 also comprising a backup VoiceXML Interpreter communicating with said storage device, the backup interpreter providing a response to a user in the event of a failure associated with a primary voice response system.
4. (Previously Presented) A system according to claim 3, wherein said storage device comprises a memory database external to said backup VoiceXML Interpreter.
5. (Cancelled)
6. (Cancelled)
7. (Cancelled)
8. (Cancelled)

9. (Cancelled)
10. (Cancelled)
11. (Previously Presented) In an interactive voice response system, a method comprising:
 - retrieving documents encoded according to VoiceXML;
 - compiling the retrieved documents into compiled document data in executable form;
 - caching the compiled document data for later retrieval and execution.
12. (Previously Presented) A method as in claim 11 further comprising:
 - storing state information related to execution of said compiled document data.
13. (Previously Presented) A method as in claim 12 further comprising:
 - providing a backup VoiceXML Interpreter that utilizes the stored state information to support continued service in the event of a failure.
14. (Cancelled)
15. (Cancelled)
16. (Cancelled)
17. (Cancelled)
18. (Cancelled)

19. (Cancelled)
20. (Previously Presented) An interactive voice response system configured as a server that provides requested audio information associated with text-based documents, the server comprising:
 - an execution thread that processes an incoming request and, based on an audio input from a given user, identifies a request for audio information associated with a text-based document; and
 - a fetcher that receives a signal from the execution thread to search a cache for executable code associated with the requested audio information, the fetcher retrieving corresponding executable code from the cache for execution by the execution thread to satisfy the request for audio information associated with the incoming request.
21. (Previously Presented) A server as in claim 20 further comprising:
 - a compiler that converts the text-based document into executable speech code for storage in the cache prior to receipt of the incoming request.
22. (Previously Presented) A server as in claim 20, wherein the fetcher initiates communication with a remote server to retrieve a text-based document associated with the requested information if corresponding executable code is not stored in the cache.
23. (Previously Presented) A server as in claim 22 further comprising:
 - a compiler that converts retrieved text-based documents into executable code for storage in the cache.

- 5 -

24. (Previously Presented) A server as in claim 20, wherein executable code stored in the cache is concurrently utilized by multiple execution threads to provide a response to multiple users.
25. (Previously Presented) A server as in claim 20 further comprising:
a storage device to store state information related to the executable code executed by the execution thread to satisfy the request for audio information associated with the incoming request.
26. (Previously Presented) A server as in claim 20, wherein the executable code retrieved from the cache is associated with a corresponding viewable text-based document available on the World Wide Web.
27. (Previously Presented) A server as in claim 20, wherein the execution thread receives the incoming call from a switchboard.
28. (Previously Presented) A server as in claim 20 configured as a VoiceXML interpreter.
29. (Previously Presented) A server as in claim 20 coupled to a data base to store state information associated with executable code being executed by the execution thread, the state information accessible by a backup VoiceXML interpreter to provide service in the event of a failure.
30. (Previously Presented) A method of providing requested audio information associated with text-based documents, the method comprising:
processing an incoming call based on an audio input from a given user;
identifying a request for audio information associated with a text-based document;

searching a cache for executable code associated with the requested audio information, the executable code generated in response to a previous request from another user for audio information associated with the text-based document; and

executing corresponding executable code from the cache to satisfy the request for audio information associated with the incoming call.

31. (New) A method as in claim 30, wherein searching the cache for executable code associated with the requested audio information includes:
 - searching amongst multiple sets of stored executable code in the cache for the executable code associated with the requested information, the multiple sets of executable code in the cache corresponding to documents previously compiled as a result of other respective users previously requesting audio information associated with the documents.
32. (New) A server as in claim 21, wherein the compiler converts the text-based document into executable code in response to a previous request by another user for the text-based document.
33. (New) A server as in claim 23, wherein the executable code stored in the cache is used at a later time to respond to corresponding future requests with respect to the text-based documents.
34. (New) An interactive voice response system that provides requested audio information associated with text-based documents, the interactive voice response system comprising:
 - an execution thread that processes an incoming request and, based on an audio input from a given user, identifies a request for audio information associated with a text-based document;

a cache that stores sets of executable code associated with corresponding previously compiled documents that can be requested from the given user; and

a fetcher that receives a signal from the execution thread to search the cache for executable code associated with the requested audio information, the fetcher conditionally retrieving corresponding executable code from the cache for execution by the execution thread to satisfy the request for audio information associated with the incoming request.

35. (New) An interactive voice response system as in claim 34, wherein the corresponding executable code is stored in the cache as a result of a previous request with respect to the text-based document, the fetcher searching the cache in order to retrieve the corresponding executable code from the cache for execution of the corresponding execution code by the execution thread to satisfy the request for audio information associated with the incoming request.
36. (New) An interactive voice response system as in claim 35, wherein the corresponding executable code is executable speech code, the interactive voice response system further comprising:

a compiler that converts the text-based document into the executable speech code for storage in the cache prior to receipt of the incoming request.
37. (New) An interactive voice response system as in claim 36, wherein the fetcher initiates communication with a remote server to retrieve a text-based document associated with the requested information over a network connection if the corresponding executable code were not stored in the cache.

- 8 -

38. (New) An interactive voice response system as in claim 36, wherein the corresponding executable code fetched from the cache is concurrently utilized by multiple execution threads to provide a response to multiple users for requests with respect to a same text-based document.
39. (New) An interactive voice response system as in claim 36, wherein the corresponding executable code retrieved from the cache is associated with a corresponding viewable text-based document accessible over the World Wide Web.
